

PROBLEM STATEMENT

1. Introduction

The fashion industry is growing rapidly, and people often need different types of clothes for weddings, parties, festivals, college events, photoshoots, and other special occasions. However, purchasing new clothes for every occasion can be expensive. Many clothes are used only once or twice and then remain unused. This creates a need for an affordable and convenient clothing rental system.

2. Problems in the Existing System

Traditional clothing rental services mainly depend on physical shops or informal communication through phone calls and social media. Customers need to visit different shops to check clothes, sizes, prices, and availability. This process is time-consuming and inconvenient. Manual record maintenance can also cause problems such as incorrect booking details, duplicate bookings, missing records, and difficulty in tracking rented clothes.

3. Difficulty in Finding Suitable Clothes

Customers may find it difficult to search for clothes based on their preferred size, color, category, brand, price, and occasion. They may have to spend a lot of time visiting different stores before finding a suitable dress. There is also no easy way to compare multiple clothing items and their rental prices in a traditional system.

4. Problems Faced by Clothing Owners

People who own clothes that are rarely used may want to rent them to others and earn additional income. However, they may not have a proper platform to display and manage their clothes. Managing clothing details, rental requests, availability, payments, and returns manually can become difficult, especially when the number of clothing items and customers increases.

5. Booking and Availability Issues

In traditional rental systems, customers may not know whether a particular clothing item is available for their required date. This can result in unnecessary visits and booking conflicts. A proper online booking system is required to display the availability of clothes and manage rental dates effectively.

6. Payment and Return Management

Manual payment handling can create confusion regarding rental amounts, payment status, and transaction details. Similarly, tracking return dates and the condition of returned clothes can be difficult. A centralized system is required to maintain payment information and return details in an organized manner.

7. Proposed Solution

The proposed Clothing Rental Marketplace Platform provides a centralized online system that connects customers and clothing owners. Customers can register, search for clothes, check availability, view details, select rental dates, book clothes, and make payments. Clothing owners can add their clothes, update clothing information, manage availability, view bookings, and track returns. The system can also provide reviews and ratings so that customers can share their experience.

8. Role of Administrator

The administrator manages the overall platform and monitors users, clothing listings, categories, bookings, payments, and other activities. This helps maintain the quality, security, and proper functioning of the platform.

9. Expected Benefits

The system reduces manual work and makes the rental process faster and more convenient. Customers can find suitable clothes from one platform, while owners can earn income from unused clothes. The platform also encourages clothing reuse, which can reduce unnecessary purchases and support a more sustainable approach to fashion.

10. Conclusion

The Clothing Rental Marketplace Platform provides a simple and organized solution for the problems faced by customers and clothing owners in traditional rental services. By combining clothing listings, search, availability checking, booking, payment, return tracking, reviews, and administration in one platform, the system makes the rental process more convenient, reduces manual work, and provides a better experience for both customers and owners.
